

LUNCH BOX

ABSTRACT

A lunch box includes a housing that has top and bottom surfaces. The housing further has sidewalls integral with the bottom surface and preferably extending upwardly therefrom. Support members are secured to the plurality of sidewalls. The divider plates are removably attachable to the support members. A divider bar is slidably positionable into corresponding slots on the divider plates. The divider bar also has slots formed along a length thereof. Divider members have a plurality of slots formed therein for selectively engaging the divider bar. The divider bar and the plurality of divider members advantageously cooperate with each other for maintaining food products during transportation. The lunch box further has a zipper for attaching the top surface to the housing. A flexible handle is also connected to the housing.
